WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

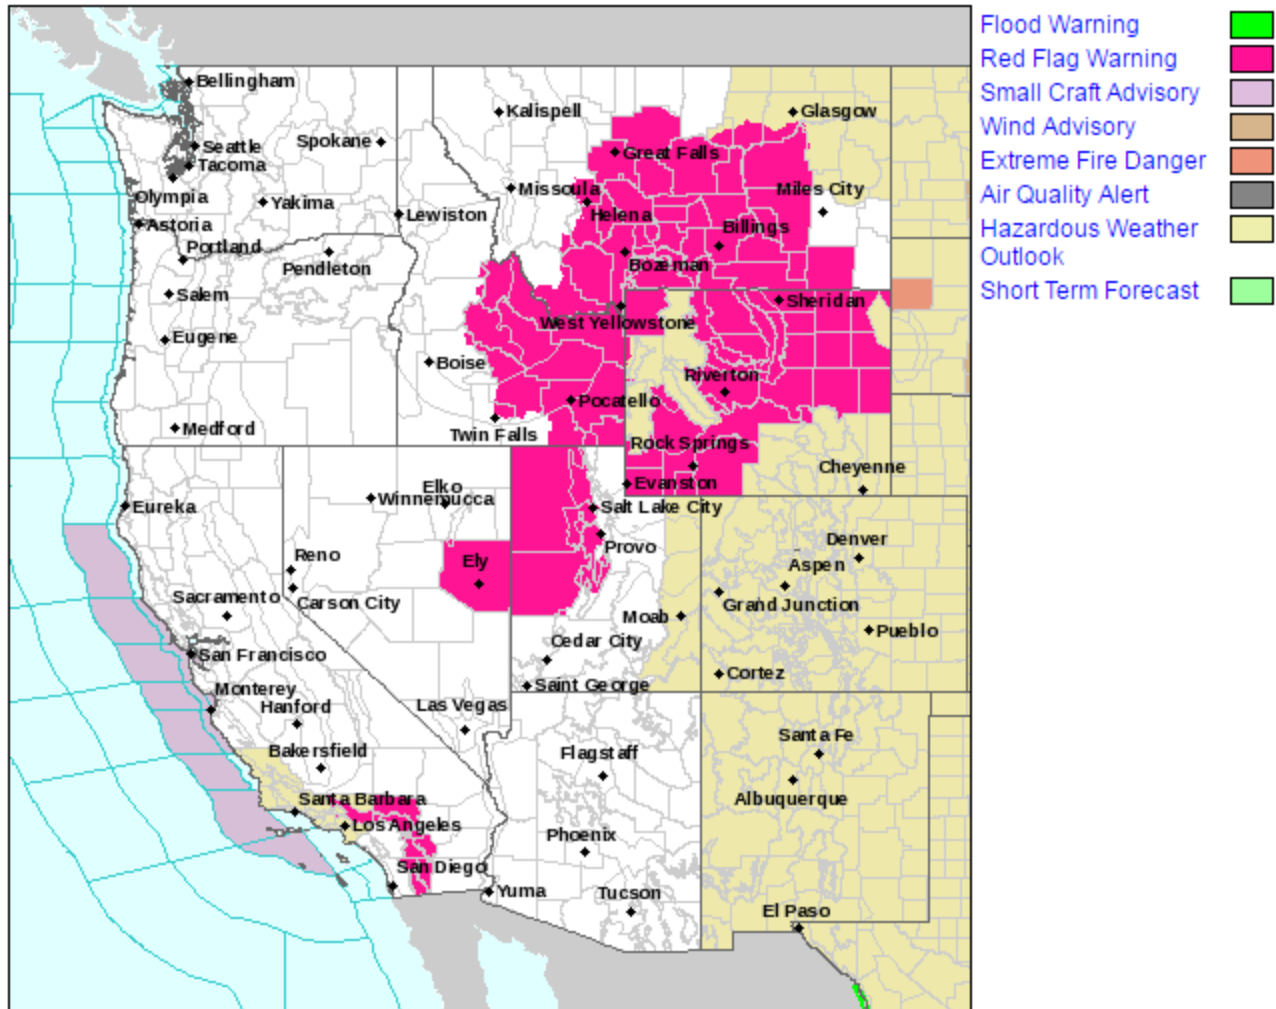

A low pressure trough will be over the western portion of the region today, then shift to eastern areas through 09/03/16. A few disturbances dropping down the west side of the trough will bring variable cloudiness to the region with occasional isolated light showers in far northern areas through early 09/04/16. Mild and occasionally breezy weather will prevail. Areas east of the Cascade-Sierra crest will see south to southwest winds gust to 30-35 mph with relative humidity (RH) dropping to 8-18% again this afternoon. These winds fall just below High Risk criteria. The same winds can be expected in exposed areas west of the crest, but with humidity in the 12-24% range. Coastal areas will benefit from the marine layer that moves well inland each evening. Temperatures throughout the week will be 2-5 degrees below normal. Northern areas will be partly to occasionally mostly cloudy, while areas farther south will be mostly clear to partly cloudy.

On 09/03/16 once the trough will shift to our eastern areas winds will turn northwest to northeast, with gusts in the wind-prone areas of the Sacramento Valley and nearby foothills reaching 25 mph 09/01/16 through early 09/03/16. This will cause humidity to drop to 8-18% on the west side of the crest, with the exception areas along the immediate coast. Temperatures, clouds, and wind speeds will remain about the same. At this time the northwest to northeast winds that will result in and around the Sacramento Valley are expected to remain below High Risk criteria. From 09/04/16 through the middle of next week the trough will remain nearly stationary over the region and produce mild and breezy conditions with occasional light showers in far northern areas.

SOUTHERN CALIFORNIA

A longwave trough will remain parked over the area the rest of the week and into the weekend which will result in breezy and cooler weather the next several days. Onshore flow will become stronger which will result in deeper and more widespread marine layer coverage. High temperatures will be 5-8 degrees each day through 09/03/16, and by the weekend, temperatures will be a few degrees below normal with highs in the 70s in the mountains to the mid to upper 80s in the valleys. Marine layer cloudiness may reach the lower coastal slopes below 3,500 feet by 09/03/16 and 09/04/16. The increasing onshore flow will lead to strong winds across the deserts and adjacent areas of the mountains across Southern California. Expect west winds of 15-25 mph with gusts to 35 mph each afternoon through 09/04/16 across the Kern County Mountains, Antelope Valley, Banning Pass and the eastern Cleveland National Forest. Some gusts to 45 mph will be possible in these same areas 09/02/16 and 09/03/16 afternoon. While lower elevations will see an increase in humidity, elevations above 4,500 feet may see afternoon relative humidity (RH) drop into the teens for 4-6 hours each afternoon. The lowest RH the next few days will be across desert adjacent areas of the Angeles and San Bernardino National Forest where local down sloping effects will lead to RH dropping into the single digits. A warming trend is expected next week and temperatures should be close to seasonal averages by 09/06/16. No thunderstorms are expected during the period.
